

## CHRIS SUERO (#11), NEW YORK METS

**Level:** AA (Binghamton Rumble Ponies)

**Position(s):** C, OF, 1B

**Age:** 22

**B/T:** R/R

**Dates Seen:** 6/10/26, 6/12/26, 6/14/26

**Projected Role:** Bat-first Reserve

**Ceiling:** Everyday Regular

**Floor:** Multi-positional Bench Piece

### Report: 2026 Preseason

| Org Rk | Ovr Rk | ETA  | FV  |
|--------|--------|------|-----|
| 13     | N/A    | 2027 | 40+ |

| Hit     | Game Power | Raw Power |
|---------|------------|-----------|
| 20 / 30 | 40 / 45    | 50 / 55   |

| Speed   | Field   |
|---------|---------|
| 60 / 60 | 30 / 40 |

### Swing

Suero started at DH on 6/10 before playing C on 6/12 and 6/14. He shows an athletic, agile frame with room to add strength and grow. Suero has a fluid swing, with a compact stance and a slight uppercut. His lower half is very powerful, and he torques into his backside and scissor kicks his back leg back to help him extend through the ball. In his stride, Suero has a low leg lift and will hang the foot for half a second, coiling into his back-leg load before planting and firing his hips. He does tend to get on top of the ball and generate a lot of topspin, which can limit carry distance despite his easy power and high exit velocities. On a single to right and a lineout to 3rd, you could especially see the topspin forcing the ball down in front of the LF and down at the 3B for an out. That topspin may also be tied to his 49.2% pull rate, though that is down from 54.5% from 2024-2025. Suero frequently tries to access his pull-side power, as most of his singles this year have gone up the middle or oppo, with more extra-base hits to the pull side. When he does pull the ball with backspin, the ball flies, as he showed by blasting a home run to left-center on 6/12.

### Approach

His aggressive approach is clear: a “Yes-Yes-No” load, firing the hips hard while showing the ability to keep his hands back on balls out of the zone and offspeed pitches. He showed good plate discipline to get ahead in counts, though that discipline faded in hitter-friendly counts, where he was not afraid to ambush 3-0 and 3-1.

### Projection

Suero is one of the more interesting prospects in the Mets system when considering positional versatility, athletic ability, and current numbers. He is currently slashing .192/.349/.409, with 11 home runs and 19 stolen bases<sup>1</sup>. Despite a clear contact issue, he has still

---

<sup>1</sup> As of 6/25

displayed good on-base ability and a unique power/speed combo at his position. His large gap between batting average and on-base percentage shows good vision and discipline to draw walks, even when the contact is not there. With good on-base ability and good slug potential, even an average contact rate would greatly improve his slash line. Suero is also on pace to put up north of 25 home runs and 35 stolen bases, and that 20/20 or 30/30 upside is extremely valuable. Defensively, he showed good athleticism on foul pop-ups behind the dish, but did not flash anything eye-popping behind the plate in terms of blocking and framing. Long-term, his versatility will be his biggest strength on defense, as he can move between catcher, infield, and outfield. While he may not be elite at any one position, his athleticism should provide the Mets with positional versatility. Overall, Suero's best path is to pair his raw power with better backspin and enough contact to maximize his power-speed combo, while maintaining positional versatility.

### ***2026 Season***

Suero has continued his good play through June, improving his statistics after a tough May. In June, he increased his batting average by .012 and his OPS by .083 points. His slash is still nothing eye-popping, but he continues to build on his power increase in 2026. His K% and BB% have remained consistent from 2025 to 2026 so far, but his ISO power is at .216, up from .103 in AA last year. Overall, Suero is producing a wOBA of .344, an increase from his 2025 wOBA of .338. He has improved month over month this year, and his continued ability to hit for power and get on base should continue this upward progression. His OBP has been consistent throughout the 3 months, ranging from .341 to .355. His batting average increased from a low of .159 in April to .217 in June, while his slugging percentage increased from a low of .368 in May to .464 in June. Suero's aggressive approach and tendency to ambush will most likely keep him from being a high-average hitter, but he continues to offset that with his ability to get on base and slug. I expect him to continue to perform at the plate over the rest of the AA season and put on a strong second half for the Rumble Ponies.

### ***Development Path***

In AAA for the Syracuse Mets, there are 3 catchers on the roster: Kevin Parada (former first-round prospect having a breakout year), Hayden Senger (defensive-minded catcher with experience in MLB), and Ben Rortvedt (28-year-old backup). With Senger currently on the 40-man roster and Parada having a career year in AAA, the best path forward for Suero is to continue getting playing time in AA. Suero is 22 for the entirety of the 2026 season, and with his positional versatility and depth ahead of him in the system, there is no need to rush him up to AAA. His goal for the second half of 2026 should be to continue making good swing decisions and improving his contact rate to pair with his raw power, while also honing his defense behind home plate and continuing to expand his versatility around the diamond.
