COMBINING RAW POWER WITH BETTER BALL FLIGHT

Caglianone got a taste of major league pitching in 2025, gathering 232 plate appearances. Caglianone struggled to the tune of a 47 wRC+ and a wOBA of .239. Caglianone has consistently shown plus exit velocities but has struggled to consistently barrel up and lift the ball to take advantage of his raw power. In 2025, Caglianone had an average launch angle of 4.1 degrees, an average EV of 89.4 MPH, and a hard-hit% of 42.4%. In 2026, those metrics improved to 7.7 degrees, 93.1 MPH, and 54.4%, respectively. Caglianone sports a 126 wRC+, and his wOBA currently sits at .356, almost identical to his xwOBA at .357.

HUNTING PITCHES IN HIS ZONE

Caglianone's Swing% by zone, 2025 vs. 2026

The visual shows that the increase has come primarily from becoming more aggressive on strikes in the middle and upper portions of the zone. His swing% across the middle row rose from 54-69% to 74-79%, while the upper row increased from 68-76% to 72-79%. Caglianone is giving himself more opportunities to make hard contact, consistent with his improved overall results. Caglianone has moved from the 46th percentile in hard-hit% in 2025 to the 98th percentile in 2026, with his average exit velocity increasing from 89.4 MPH to 93.1 MPH.

HUNTING PITCHES IN HIS ZONE

Caglianone has not made any substantial changes to his batting stance or swing. Compared to 2025, Caglianone's contact rates are down 2.0% overall. However, Caglianone's z-swing% is up 6.5%, from 65.3% to 71.8%. Caglianone already attacked pitches in the zone at a higher clip than most, but in 2026 he has become more aggressive on hittable strikes without simply expanding his swing decisions. His strong batted-ball results and ability to produce high exit velocities on more pitches in the zone have benefited him immensely.

The next step will be to determine whether he can generate more consistent lift without sacrificing the exit velocities that make his power profile unique. A below-average launch angle does not inherently prevent offensive success; Fernando Tatis Jr. has a 122 wRC+ despite a below-average launch angle (5.5 degrees). For Caglianone, it will be worth monitoring whether his current performance remains sustainable with his present LD% and FB% or whether further adjustments are needed to access his raw power more consistently. If he can maintain his high exit velocities while producing more optimal launch outcomes, Caglianone has the frame and natural power to develop into an impact left-handed power hitter.
